

ABSTRACT

1 A method includes advertising a policy characterizing communication
2 properties supported by a node. The policy may be distributed to another node in
3 response to a request for the policy. Policy expressions in the policy include one
4 or more assertions that may be grouped and related to each other in a plurality of
5 ways. A system includes a policy generator for generating at least one policy
6 characterizing properties of a node. A policy retriever retrieves a policy from
7 another node and a message generator generates a message to the other node,
8 wherein the message conforms to the policy from the other node.
